Safety Precautions

- Please read and understand these specifications thoroughly before using the printer. Please keep the specifications carefully in a place where they may be easily consulted when the printer is used.
- Please do not modify or service this printer as this may cause unpredictable faults to occur.
- The product is not intended to be installed in devices such as those used in life-support medical equipment, undersea relays, and aerospace applications or for nuclear power control, in which extremely high reliability is required. If you are considering such applications, please consult our customer service department.
- There is a general possibility of component failure. Every effort has been made to improve product quality but such failures cannot be

completely excluded. Please assume that such failure may occur before using this printer.

We would urge that these specifications should be thoroughly understood and the printer used safely in your company or associated organisation. Please indicate or describe in your products and in the user manuals those items, which are related to the prevention or avoidance of danger and draw these to the attention of the eventual client (the user).

1 SYSTEM DESCRIPTION

This reference manual describes the specifications, functions, and operating procedures for the PRN608-S Interface Board. The PRN608-S is an interface board for the FTP608 series printer mechanisms.

This reference manual also describes the print operation of the FTP608 series. Read this reference manual thoroughly before using the PRN608-S. PRN608-S is designed for the following Fujitsu printers:

FTP-628MCLxxx FTP-638MCLxxx

PRN608-S consists of an interface board. The communication is RS232, USB or IRDA. PRN608-S can print graphic data either compressed or noncompressed. Burn time can be set to control the printing intensity Windows 95/98, 2000, NT and CE drivers are available at http://www.if-com.com, for easy operation by PC. Linux drivers are available upon request.

2 INSTALLATION

2.1 Unpacking

Remove the cover observing precautions for Electro Static Discharge (ESD). Make sure that board is handled with care with respect to Electrostatic environment.

2.2 Labels

PRN608-S has 3 labels;

Label 1 on backside ex. Ifxxxxx is a unique ID number. For service and question based upon 1 particular board please refer to this number. Label 2 on topside ex. PRN608-S is part number. Please refer to this number upon reordering. Make sure that software revision is applied at same time.

Label 3 is an internal code. Please ignore.

2.3 Installation

PRN608-Sis fastened in the product by 4 M3.3 screws. The cables (for the thermal head, the stepper-motor and detector) are placed in the

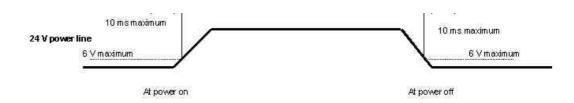

thermal printer connector on the PCB. 1 Mounting hole is grounded. See drawing for more details.

- (a) To connect or remove the connector, always turn off the power in advance. If the connector is connected or removed while the power to the printer is on, errors may occur.
- (b) The connector of each cable must be correctly locked and connected. The connector at the head side has no lock feature. Check that the connector at the head side is completely inserted.
- (c) To install the interface, carefully check each cable so that excessive force is not applied to each cable. Especially, carefully check the head connection cable because it affects the head pressure force. If the print head connector is not completely connected, overheating or burning may occur in the print head.

2.4 Power supply

Single power supplies for the PRN608-Scontroller board. Voltage range is 6-8,5VDC. 4A minimum @ 7,2V. Make sure that voltages never exceed 8,5VDC.

- (a) The power supply unit that satisfies the specified specifications must be used. If a power supply unit that does not satisfy the specified specifications is used, normal operation is not assured and errors may occur.
- (b) To turn on or off the power, a protective circuit must be mounted on the control board in advance. For safety, the following voltage change conditions must be satisfied:

2.5 Settings

Following below description can change default settings. Baud rate is default 115.200, however standard PC's today cannot handle this Baud rate. Windows OS does not support speed higher than 115.200 Baud,

even when setup menus can be set to higher speed. In order to obtain higher speed you need to install 3rd part utility program on PC. Please visit <u>www.if-com.com</u> for further information.

- 1. Turn off power
- 2. Press Key 1 low while power up. Board is now in setting mode. Text will be printed on paper for further information
- 3. By activating key 1 and 2 you can change following parameters:
 - a. Test printout
 - b. Select Command set
 - i. I/F-COM command set (Default)
 - ii. Seiko compatible command set (Optional)
 - iii. Fujitsu compatible command set (Optional)
 - iv. APS compatible command set (Optional)
 - v. ESC/POS compatible command set (Optional)
 - c. Baud rate
 - i. 9600
 - ii. 19.200
 - iii. 38.400
 - iv. 57.600
 - v. 115.200 (Default)
 - vi. 230.400
 - vii. 460.800
 - d. Parity
 - i. 0 (Default)
 - ii. 1
 - e. Data bit

 - vi. -6
 - vii. -7
 - viii. -8
 - ix. -9

Settings will be effective upon turn off and on.

- * FTP628MCL00x/30x must be set as 384 dots.
- * FTP6x8MCL05x/1xx and FTP6x8MCL35x is auto detected.

2.6 Serial Input/Output

If BUSY control is selected:

When 236 bytes of data have been stored in the input buffer, the SBUSY signal becomes high to request that the computer temporarily stop sending data. When the amount of data stored in the input buffer becomes 235 bytes or less, the SBUSY signal changes to low to request that the host device continue data transfer. Up to 16 bytes of input data are guaranteed after the SBUSY signal has become high. When an error occurs, the SBUSY signal becomes high. Data input is prohibited until the error is cancelled.

If Xon/Xoff control is selected:

When 188 bytes of data has been stored in the input buffer, Xoff (13_{16}) is output through the TxD terminal to request that the host device temporarily stops sending data. When the amount of data stored in the input buffer becomes 124 bytes or less, Xon (11_{16}) is output to request that the computer continues data transfer. Up to 64 bytes of the input data are guaranteed after

Xoff has been output. When an error occurs, the Xoff signal is output to prohibit the data input.

When the error is cancelled, Xon is output.

2.6.1 Serial data transfer

The PRN608-Stransfers various data other than the Xon and Xoff codes which are output when controlling Xon and Xoff. Regardless of whether the input mode is serial or parallel, the following

data is transferred through the TxD terminal.

(a) Error codes when a hardware error occurs at initialisation

(b) The data when executing the Vhead voltage response

(c) The data when the error status response is set and an error occurs

(d) The data when executing the execution response request

(e) The data when executing the remaining RAM capacity response (DC2+'r')

(f) The data when executing the environmental temperature response (DC2+'t')

At the selection of serial input, data (b) through (f) is transferred according to the transfer conditions, which are set using the function switches. However, the hardware error code (a) has the same conditions as those for parallel input.

When transferring data, data control by SBUSY and Xon/Xoff is not executed and the data is transferred with no conditions.

All of the transmission conditions of serial data transfer for sending hardware error codes are fixed at the selection of parallel input as follows:

2.6.1.1 Serial input/output port

Serial data output (TxD)

When Xon/Xoff control is selected, the Xon/Xoff signal is output. Data is output according to the transmission conditions, which are set by the function switches.

All response data is output.

Serial data input (RxD)

Data input port

Data is input from the host device according to the transmission conditions, which are set using the function switches.

Serial busy (SBUSY)

Indicates whether or not the PRN608-S is ready to receive data. When the SBUSY signal is low, data can be input.

When Xon/Xoff control is selected, SBUSY is always low.

2.6.2 Setting functions

Error processing when receiving serial data

The PRN608-S receives and checks serial data according to the transmission conditions.

When the PRN608-S has received one byte of data without errors, the data is stored in the input buffer.

If there are any errors, the following data is stored in the input buffer according to the type of error.

Error type Error code

Parity error (!: 21₁₆)

Framing error (?: 3F₁₆)

If the input data cannot be printed correctly and instead "!" or "?" is printed, the transmission conditions between the host device and the PRN608-S most likely does not match. If this happens, adjust the conditions so that they match.

2.7 THERMAL HEAD CONTROL

Data Transfer to the Thermal Head

The PRN608-S transfers one dot line of data at 6 Mbps synchronized with the CLOCK signal.

The data is transferred in order to the shift register inside the thermal head from the left (when facing the paper feed direction).

The transferred data is then transferred by the head latch signal to the latch register inside the thermal head. Turning on the head strobe signal initiates printing of one dot line of data on the thermal paper.

2.7.1 Thermal Head Drive Operation

Generally, when the line thermal head is operating, the line is divided into several blocks, which are activated one after another in succession.

For the line thermal head of the FTP608 printer mechanism, the line is divided into 7 blocks called physical blocks, 216, 288 or 416 dots with each. A strobe signal (/ST1 to /ST7) is allocated to each physical block to activate it. To drive the head, physical blocks are activated in groups. The group of physical blocks is called a logical block.

For the PRN608-S either dynamic division or fixed division can be selected as the method of division for logical blocks. This selection is made through a function. See settings for more information.

2.7.2 Peak power limitation

The PRN608-S counts the number of dots activated in each physical block and groups the physical blocks into logical blocks to print a single

dot line so that the number does not exceed the specified maximum number of activated dots. The PRN608-S determines logical blocks each time it prints a single dot line.

In dynamic division, in order to avoid unclear printing, at the first step of the motor the thermal head is driven and at the second step the paper is fed.

Also, since the order of the printing blocks and printing speed are changed in each dot line according to the content of the print data, print quality may be lower than that in fixed division. If print quality is regarded as important, printing in fixed division is recommended. The maximum number of activated dots in the initialisation status is specified using the function switches.

64 through 256 dots can, however, are set using the command for setting the number of dynamic division dots.

When the maximum number of activated dots is 128 dots, and all of the dots are driven, as shown in

2.7.3 Head Control Circuit

The PRN608-S has a function for measuring the resistance of the thermal head connected to the FTP608.

The PRN608-S measures the resistance of the thermal head and detects the errors at initialisation.

Based on the measurement, the PRN608-S determines how much energy to apply. No adjustment is needed for replacing the FTP608 to get the best printing.

2.7.4 Head temperature measurement circuit

The thermistor is mounted on the FTP608 to measure the temperature of the thermal head.

The PRN608-S determines the energy to be applied to the head and also checks for head temperature errors.

If the temperature of the thermal head is -10 °C or lower, or 80 °C or higher, the PRN608-S stops driving and puts the printer in head temperature error status. If the temperature of the thermal head is returned to from -5 °C to 75 °C, the printer goes to printable status.

2.7.5 Vhead interrupt circuit

This circuit interrupts Vhead to prevent electrolytic corrosion of the thermal head and to enable the detection of the resistance mentioned above.

Electrolytic corrosion may significantly shorten the life of the thermal head. Thermal paper ordinarily contains electrolytic material to prevent sheets from sticking to each other due to static electricity. If there is too much of this electrolytic material, high temperatures and humidity cause the material to ionise, resulting in electrolytic corrosion of the thermal head.

The PRN608-S turns the FET off and breaks the Vhead applied to the thermal head during waiting status to prevent electrolysis corrosion of the thermal head.

Specifications

Default settings

Interface	Serial RS232C, USB or IRDA
	115.200 baud, 8 data bit, none parity, 1 stop bit, hardware
Data format serial	handshake. Baud rate can be changed by software.
	USB Printer class specification.
Data format USB	http://www.usb.org/developers/data/devclass/usbprint11.pdf
	IRDA (Ircomm specifications)
Data format IRDA	http://www.irda.org/standards/pubs/ircomm10.pdf
Command set	I/F-com
Transmission to host	Requested status etc.
Printer supply	18V to 24V DC
Power on self test	Feed
Voltage compensation	Burn time
Current consumption	Operating 130mA, Printing up to XA @ 24V (TBD)
Printing speed	60mm/sec FTP628MCLxxx, 60mm/sec FTP638MCLxxx
Fontset	Western (Code 850, char 32-159)
Character size	8x14, 8x28, 16x14, 16x28, 16x56, 32x28, 32x56, 64x112
Character type	Normal, Bold, Underline, Italic, Reverse (white on black)
Default font	16x28
Paper detect	Digital
Graphics	Normal / Compressed
Auto load	80mm
Form feed	50mm
Maximum dimensions	Width 77mm, Depth 50mm, Connected height 15mm
Mounting holes	Width 71mm, Depth 44mm, Diameter 3.3mm
Weight	25g
Temperature	Storage -40°C to +85°C 0-90 Operating 0C to +85°C 10-90%RH
Shock	100G XYZ
EMC	Emission: E-Field EN50081-1-1, Conducted EN50081-1-2
	Immunity: E-field EN50082-1-1, Conducted EN50082-1-2, Over voltage EN50082-1-3
	ESD Contact discharge 4kV, air discharge 8kV
Drivers	Windows 9x, Windows CE, Windows NT, Linux, Windows2000 and Windows XP
Approvals	CE, UL
Accessories	Serial Interface cable: CBL-002, 9pol SubD, female
	Power cable: CBL-025

3 Function

3.1 General

Notice, when data is sent from the external equipment to the printer controller, all data has to be sent as binary file. If data is being sent as a character file, and some data in the file is equal to EOF, the rest will not be received.

3.2 Serial communication.

Standard communication is; Baud rate; 115.200 Baud Data bits = 8 Stop bits = 1. Parity = None Flow control = Hardware handshake

Baud rate can be changed by a software command or by entering setting mode..

3.3 USB communication.

Build in USB interface is 100% compliant to USB 1.1 and fully approved by the USB organisation. For more details please contact I/F-COM. By plug USB cable - Host system will recognise I/F-COM interface board.

Before connecting USB cable please set USB port as offline. Interface board will automatically online USB port. Data cannot be send from interface board to host. USB is not a bi-directional communication.

3.4 IRDA communication.

PRN608-S is prepared for IRDA via connector for IRDA transmission. Please contact I/F-COM for more information.

3.5 Firmware upgrade.

If firmware needs to be changed, alternative firmware can be downloaded.

Please contact I/F-COM for firmware upgrade or changes. The steps to download an alternative firmware in DOS are the following.

These steps only work for a serial connection, look further down how to do it with USB.

- 1. Power the system off.
- 2. Disconnect printer.
- 3. Short circuit the pins "upgrade firmware"
- 4. Turn on printer
- 5. Write the following command "mode com1:9600,n,8,1", this command ensure that the serial port is at a known state.
- Write the following command "xmode 1 +", this command sets the baud rate to 115.200, the xmode program can be downloaded from the I/F-COM web site <u>http://www.if-com.com/data/drivers/xmode.zip</u>
- 7. Run the following command, "copy "filename" /b com1". The filename represents the path and the filename of the new firmware file. This file can be downloaded from website, or can be emailed by I/F-COM.

I/F-COM also offers a Windows utility program in order to download firmware through serial port. Visit <u>www.if-com.com</u> for more information.

For further information about downloading with the driver, can be found in the driver installation guide.

3.6 Auto form feed

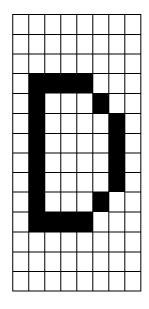

When paper no paper is present, it is possible to form feed new paper automatic. While thermal head is down, place the paper at the roller. After 2 seconds (default) the paper will be pulled in automatically. Form feed wait time is 2 sec (default), but can be changed by a command.

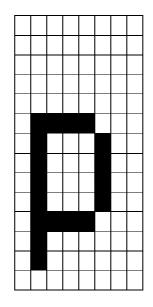

3.7 Character design

The following figures describes the design of different types of characters (small):

3.7.1 Normal Character.

3.7.2 Low Character

3.7.3 Underline

When underline characters are printed the last line in the character matrix will be marked.

3.7.4 Bold

When bold characters are printed the character is or with itself shifted right.

3.7.5 Reverse

When reverse characters are printed the character matrix will be negated.

3.7.6 Italic.

When Italic characters are printed every line will be shifted the following number of dots to the right: (Line number from bottom)/4

3.7.7 Font sizes.

Font	Width	Height
Small	Normal	Normal
Low	.ow Double	
Narrow	Normal	Double
Normal	Double	Double
Wide Double		Quadruple
High	Quadruple	Double
Large	Quadruple	Quadruple
Xlarge	Octuple	Octuple

When the size is normal or greater a build in smooth function will smooth the characters.

3.8 I/F-COM simple command set.

The following commands are use when communicating with the printer controller. All other commands is ignored

3.8.1 Small Font [Name] Small Font (8x12) ASCII NUL [Format] 00 Hex Decimal 0 Chooses small font from the current print position. [Description] 3.8.2 Low Font Low Font (16x12) [Name] SOH [Format] ASCII Hex 01 Decimal 1 [Description] Chooses low font from the current print position. 3.8.3 Narrow Font [Name] Narrow Font (8x28) [Format] ASCII STX Hex 02 2 Decimal [Description] Chooses narrow font from the current print position. 3.8.4 Normal Font [Name] Normal Font (16x28) ASCII ETX [Format] 03 Hex 3 Decimal [Description] Chooses normal font from the current print position. This is the default font after power up or reset. 3.8.5 Wide Font [Name] Wide Font (32x28) ASCII EOT [Format] 04 Hex Decimal 4

[Descriptio	n] Chooses wide font from the current print position.
3.8.6 High Font [Name] [Format] [Descriptio	High Font (16x56) ASCII ENQ Hex 05 Decimal 5 n] Chooses high font from the current print position.
3.8.7 Large Font [Name] [Format] [Descriptio	Large Font (32x56) ASCII ACK Hex 06 Decimal 6 n] Chooses large font from the current print position.
3.8.8 Xlarge Font [Name] [Format] [Descriptio	Xlarge Font (64x112) ASCII BEL Hex 07 Decimal 7 n] Chooses Xlarge font from the current print position.
3.8.9 Line Feed [Name] [Format] [Descriptio	Line Feed ASCII LF Hex 0A Decimal 10 n] When the printer controller receives this byte the text data in the buffer will be printed
3.8.10 Barcode on [Name] [Format] [Type] [Descriptio received. [Barcode c [Notes]	Barcode on ASCII VT Hex 0B Decimal 11 Barcode 39 n] Turns the barcode on until non-barcode character har.] Space , \$, % , * , + , - , . , / , 0-9 , A-Z The barcode 39 must start and end with the character '*'. This character is the start and stop character in

barcode 39, and the '*' can only be used as start and end character.

If the barcode length exceeds the paper size the last barcode character will not be written as barcode. In that case the barcode cannot be read because the last character will not be '*'

3.8.11 Feed Form [Nam [Form	e]		FF 0C 12 mand is received the printer will print t has in the buffer and feed forward
3.8.12 Reverse of		Deveree off	
[Nam [Form	-	Reverse off ASCII Hex Decimal	SO 0E 14
[Desc	ription]		will switch off reverse printing
3.8.13 Reverse on			
[Nam [Form	-	Reverse on ASCII Hex Decimal	SI 0F 15
[Desc	ription]		will switch on reverse printing
3.8.14 Underline	off		
[Nam [Form	-	Underline off ASCII Hex Decimal	DLE 10 16
[Desc	ription]		will switch off underline printing
3.8.15 Underline	on		
[Nam [Form	-	Underline on ASCII	DC1

	[Description]	Hex Decimal This command	11 17 will switch on underline printing
3.8.16 Bol	d off		
	[Name] [Format]	Bold off ASCII Hex Decimal	DC2 12 18
	[Description]		will switch off bold printing
3.8.17 Bol	ld on		
	[Name] [Format]	Bold on ASCII Hex Decimal	DC3 13 19
	[Description]		will switch on bold printing
	3.8.18 Italic	; off	
	[Name] [Format]	Italic off ASCII Hex	DC4 14
	[Description]	Decimal This command	20 will switch off italic printing
3.8.19 Ital	ic on		
	[Name] [Format]	Italic on ASCII Hex Decimal	NAK 15 21
	[Description]		will switch on italic printing
	3.8.20 Initia	alise Printer	
	[Name] [Format]	Initialise ASCII Hex Decimal	SYN 16 22
	[Description]	When the printe	er controller receives this byte a reset of be initialised. This command can be

3.8.21 Request Software version

	3	Head		Closed		Open	
	4	Paper Jar	n	No error		Error	
	5	Rxerror		No error		Rx error	
	6	Buffer		Not full.		Full (less than 16 bytes left)	
	_					,	

6 Buffer Not full. 7 Always 1.

3.8.23 Request Analog voltage.

[Name]	Analog voltage		
[Format]	ASCII	EM	
	Hex	19	
	Decimal	25	
[Description]	When the print	er controller receives this byte the digital	
	value of the head voltage will be transmitted. This command can be treated even if buffer is full		

3.8.24 Request Temperature

[Name]	Request Temperature		
[Format]	ASCII	SUB	
	Hex	1A	
	Decimal	26	

[Description] When the printer controller receives this byte the digital value of the head temperature will be transmitted. This command can be treated even if buffer is full

3.8.25 Sub command set

[Name]	Sub command	l set	
[Format]	ASCII	Cn	
	Hex	1B	n
	Decimal	27	n
[Range]	n: [-128;127]		
[Description]	The n is the co	omma	nds in the sub-set.

3.8.26 Upgrade command

[Name]	Upgrade command				
[Format]	ASCII	ESC	Z		
	Hex	1B	5A		
	Decimal	27	90		
[Description]	Only used	d by tl	he I/F-COM A/S upgrade programs.		

3.8.27 Set auxiliary output

	ame] prmat]	Set auxili ASCII			n
	-	Hex	1B	, 70	
[De	escription]	the auxilia If $n = 0$, the If $n > 1$ are be turned turned off	s com ary ou nen th nd < 2 I on in f agair	mand Itput c e out 54 th n/4.0	n I is received then can be set. put will be set to off en the output will 096msec, and then output will be turned
3.8.28 Automatic sendin	•				

[Name]	Automatic sending status
[Format]	ASCII ESC a
	Hex 1B 61
	Decimal 27 97
[Description]	When this command is sent once, then the board will transmit the status every time that it change state.

3.8.29 Stop sending	automatic status
---------------------	------------------

3.8.29 Stop sei	nding automatic statu	5
	[Name] [Format]	Stop sending automatic status ASCII ESC b Hex 1B 62 Decimal 27 98
	[Description]	When this command is sent then it will turn off transmitting status.
3.8.30 Color/G	rey scale graphic	
	[Name]	Colour / Grey scale graphic
	[Format]	ASCII ESC c n Hex 1B 63 n Decimal 27 99 n
	[Description]	When this command is sent then will the board not feed. After the next graphic data (both compression and not). The n is a percent of the burn ratio, n can be from 0 to 15, and the burn ratio is 100/15*n. This command is used by the driver to make colour and grey scales printout.
3.8.31 Enable s	saving data	
	[Name] [Format]	Enable saving data ASCII ESC d Hex 1B 64 Decimal 27 100
	[Description]	This command will enable that the boards
		save values to the flash, this is made to ensure that a wrong transmission not will change settings in the board, remember to send the command "Saving data to board", to actual save the data.
		ensure that a wrong transmission not will change settings in the board, remember to send the command "Saving data to board",
3.8.32 Save da	ta to board [Name] [Format]	ensure that a wrong transmission not will change settings in the board, remember to send the command "Saving data to board",

3.8.33 Change dot size [Name] [Format] [Description	Change dot size ASCII ESC f n Hex 1B 66 n Decimal 27 102 n If n = 0x01, then the board is set to FTP628MCLxxx. If n = 0x02 then is it set to FTP638MCLxxx. The value is saved to flash,
3.8.34 Change form feed le [Name] [Format] [Description	Change form feed length ASCII ESC g n Hex 1B 67 n Decimal 27 103 n
3.8.35 Change baud rate	
[Name] [Format] [Description	for $n = 1$ to 255. The baud rate is calculated as 921600/n = new baud rate.
	For instance 921600/8 = 115200baud. The value is saved to the flash
3.8.36 Change form feed tir	ne
[Name] [Format]	Change form feed time ASCII ESC i n Hex 1B 69 n Decimal 27 105 n
[Description	

255.

3.8.37 Feed Paper

[Name]	Feed Paper		
[Format]	ASCII	GS	n
	Hex	1D	n
	Decimal	29	n
[Range]	n: [-128;127]		
[Description]	When the print	er coi	ntroller receives this command the
			lot lines. If the value is negative a
	reverse form fe	ed w	ill be made.

3.8.38 Compensate Burn time

[Name]	Compensate b	ourn ti	me		
[Format]	ASCII	RS	n		
	Hex	1E	n		
	Decimal	30	n		
[Range]	n: [-15;15]				
[Description]	When the prin	ter co	ntroller receives this command the		
	burn time will	be cor	mpensated. If a negative value is		
	send the printout intensity will be lighter and if a positive				
	value is send	the pri	intout intensity will be darker.		

3.8.39 Bar code width setting

[Name]	Bar code	width	n settir	ng		
[Format]	ASCII	m				
	Hex	1B	65	m		
	Decimal	27	101	m		
[Range]	2<=m					
[Default]	m=6					
[Description]	Parameter n is ignored					

Parameter m is used to determine the dot width of the narrow and wide bar lines. The wide bar lines is equal to m dots and the narrow is equal to m/2 dots (rounded down).

3.8.40 Bar code height setting.

[Name]	Bar code	heigh	t sett	ing
[Format]	ASCII	ESC	; h	n
	Hex	1B	68	n
	Decimal	27	104	n
[Range]	1<=n<=2	55		
[Default]	n=60			
[Description]	Paramete	er n sp	pecifie	es the height of a bar code in dots.

3.8.41 Bar code printing

[Name]	Bar code	printi	ng			
[Format]	ASCII	ESC	C k	m	n	d1 to dn
	Hex	1B	6B	m	n	d1 to dn
	Decimal	27	107	m	n	d1 to dn
[Description] printed.	Paramete	er m s	pecifi	es th	e type	e of bar codes to be

Parameter n specifies no of barcode characters.

m(dec)	Type of	Number of	Value of d
	Barcode	barcode	
		characters	
65	UPCA	11<=n<=12	48<=d<=57
67	EAN13	12<=n<=13	48<=d<=57
68	EAN8	7<=n<=8	48<=d<=57
69	Code39	Variable	Space , \$, % , * , + , - , . , / , 0-9 ,
			A-Z
72	Code128	Variable	0 to 105

UPCA: if n is 11 then the board calculate the checksum

EAN8: if n is 7 then the board calculate the checksum.

EAN13: if n is 12 then the board calculate the

checksum

Code 39: The first and last character must be '*'. This is the syntax for Code 39.

Code128. There is three subset of Code128 (Code128A, Code128B and Code128C). The start character specifies which character set to be used. The start character must be either 103 (subset A), 104 (subset B), 105 (subset C).

The following table shows the value between data (d) and barcode.

0000.0.00	Darcoue	labio

3.8.42	Black Mark							
	[Name]	Set black mark parameters:						
	[Format]	ASCII	RS	n				
		Hex	1E	n				
		Decimal	30	n				
	[Range]	n: [-15;15]						
	[Description]	When Black mark is enabled:						
	[Format]	ASCII		C+205+3+97+m+n+o				
		Hex		CD 03 61 m n o				
		Decimal		205 3 97 m n o				
	[Range]	m = Page leng		1255				
		n = Paper offset 1255						
	[Deceription]	o = Black mark length 1255						
	[Description]	At printer stop on black mark the paper will be forwarded the full length of the black mark. Paper out is						
				•				
		detected if full length of the Black Mark is feeded and sensor does not detect paper.						
		301301 0003 110						
		At no paper in printer and printing is requested, form						
		feed of black Mark Length will be executed. At no paper						
		detected the printer will stop.						
		FF=0xC Feed paper forward until next Black Mark or						
		rest of page whatever comes first.						
		The following values can be set:						
		PAGE LENGTH (default 150mm) This value is the						
		paper length	11 (00					

PAPER OFFSET (default 2mm) This value is the length between Black Mark and start of printing. Value must be between 2 mm. and Page length – 2mm. BLACKMARK LENGTH (default 15mm). This is the length of the Black Marks.

The board can be set to transmit a 'B' whenever the paper is not detected at paper detect. This is typical when the sensor encounters a Black Mark.

The following commands is used for enabling Black Mark

Default:

PAGELENGHT=150mm PAPEROFFSET=2mm BLACKMARK=120 (120/8=15mm)

ESC+205+1+98+n

n: Bit 0: if set the board will transmit 'B' every time paper is not detected at the paper detector. Bit 1: if set the Black Mark function is enable. Default n = 0.

3.8.43 Graphic data – non compressed

[Name]	Graphic data – non-compressed			
[Format]	ASCII	US	d1,d2,,dX	
	Hex	1F	d1,d2,,dX	
	Decimal	31	d1,d2,,dX	
[Range]	n: [0;255]			
	X=54 for FTP628MCLxxx, X=72 for FTP638MCLxx			
[Description]	When the printer controller receives this command the			
	X graphic bytes (d1-dX) will be printed in one dot line.			
	The MSB in d1 is the left most dot and the LSB in dX is			
	the right most dot.			

3.8.44 Graphic data - compressed

[Name]	Graphic data – compressed			
[Format]	ASĊII	Y	d1,d2,,d(-Y)	
	Hex	Y	d1,d2,,d(-Y)	
	Decimal	Y	d1,d2,,d(-Y)	
[Range]	Y: [-X;-2]			
	n: [0;255]			
	X=54 for FTI	P628M	CLxxx, X=72 for FTP638MCLxx	xx,

[Description] When the printer controller receives a byte that is –Y to –2 (Decimal 256-Y to 254) the following data is compressed data. The number of compressed graphic bytes is the negative value.

> This means: If Y = -10 (Decimal 246) the next 10 bytes is compressed data.

The compressed data is as follows. When a data byte is 0 (no dots activated) the next byte received is the number of bytes that are 0. All other data is send as non compressed. A very few lines cannot be compressed. These will if you try to compress them be longer than the noncompressed line. These must therefore be send as non-compressed data.

3.8.45 Escape sequences, overview.

ESCAPE SEQUENCES,	
ASCII	FUNCTION
NUL	Small Font
SOH	Low Font
STX	Narrow Font
ETX	Normal Font
EOT	Wide Font
ENQ	High Font
ACK	Large Font
BEL	Xlarge Font
LF	Line Feed
VT	Print barcode
FF	Forward feed
SO	Reverse off
SI	Reverse on
DLE	Underline off
DC1	Underline on
DC2	Bold off
DC3	Bold on
DC4	Italic off
NAK	Italic on
SYN	Initialize printer

ETB	Request software version
CAN	Request status

RS+n	Burn compensate
US+d1dX	Print graphic line
ESC+205+3+97+m+n+o	Set black mark parameters
ESC e+m	Bar code width setting
ESC k+m n+d1 to dn	Bar code printing
ESC h+n	Bar code height setting

4 Maintenance

4.1 Daily use

Printer and interface board must be switch off while in idle mode.

4.2 Store/Transport

The product has to be stored under ESD safe conditions, and to be packed safely during transportation.

5 Specifications

5.1 Electrical Data

Voltage: 6-8,5VDC

Current: Maximum head current: <u>Numbers of active dots * Vhead</u> 150+/-15%

Maximum motor current: 1000mA

Power up sequence:max. 10 msec. 10 - 90% Voltage appliedPower down sequence:max. 10 msec. 90 - 10% Voltage applied

5.2 Mechanical Data

Dimensions: Length, width, height: 77 mm* 50 mm * max. 15 mm Including connectors. Vibration: 100G XYZ Shock: 100G XYZ

5.3 Environmental Data

Operation:	Temperature: -20°C- +85°C
	Humidity: 10%-99% RH, without condensing
Storage:	Temperature: -40°C - +85°C
	Humidity: 0%-99% RH, without condensing
Transport:	Temperature: -40°C - +85°C
	Humidity: 0%-99% RH, without condensing

5.4 EMC & ESC

The printer controller is tested according to:				
Emission: E-Field:	EN50081-1-1			
Conducted:	EN50081-1-2			
Immunity: E-field:	EN50082-1-1			
Conducted transients:	EN50082-1-2			
Over voltage:	EN50082-1-3			
Medical equipment:	IEC601-1-2			

ESD: 4 kV contact discharge against parts exposed to contact at normal use. 8 kV air discharge.

5.5 Temperature Test

Temperature shock: (no voltage applied) -28°C to +100°C at 1 sec. 100 times: no damage.

6 Connector Pin Assignment

6.1.1 Thermal Head connector

FTP628MCL05x/1xx/35x Connector CN1: 3800-30P-T-S Mating connector part number: TBA

Pin	Function	Pin	Function
1	LED GND	16	TI1
2	+5V	17	/ST2/GND
3	P1	18	/ST1
4	GND	19	/ST7/ /AOE1
5	SW	20	/ST6/ /AOE1
6	VH	21	GND
7	VH	22	GND
8	DI	23	/LAT
9	CLK	24	DO
10	GND	25	VH
11	GND	26	VH
12	/ST5	27	/MB
13	/ST4	28	MB
14	/ST3	29	MA
15	+5V	30	/MA

6.1.2 Thermal Head connector

FTP628MCL00x/30x Connector CN: 3700-30P-T-T Mating connector part number: TBA

Pin	Function	Pin	Function
1	LED	16	/ST2/GND
2	+5V	17	/ST1
3	P1	18	TI1
4	VH	19	GND
5	VH	20	GND
6	GND	21	GND
7	GND	22	VH

8	DI	23	VH
9	/LAT	24	NC
10	CLK	25	SW
11	/ST6/ /AOE1	26	GND
12	/ST5	27	/MB
13	/ST4	28	MB
14	+5V	29	/MA
15	/ST3	30	MA

6.1.3 IRDA connector

IRDA connector CN3: B4B-ZR Mating connector part number: TBA

Pin	1	2	3	4
Function	+5V	ТХ	RX	GND

6.1.4 Cutter connector

Cutter connector CN6: 5501-04TS Mating connector: TBA

Pin	Function	Pin	Function
1	/Sense	3	CUT
2	GND	4	/CUT

6.1.5 AUX INPUT connector

Connector type CN4: 53324-0710 Mating connector part number: Housing: TBA Contact: TBA

CN4:

Pin	Function	Pin	Function
1	LED1+	4	LED2+
2	INPUT1	5	INPUT2
3	GND	6	GND
7	GND		

The paper near end status, can be seen on the LED on the aux connector, it can be reading through the status command, and if a driver is used, then it can be reading in the port monitor: If paper jam is used, then will the printer stop printing if this signal is going low, the value of this bit can be seen on the LED on the aux output connector, it can be reading by a status request, or if a driver is used, then it can be reading by the port monitor

The paper near end and paper jam is indicated on LED at the AUX connector CN4. The status of these bits can also be read with a response on a status request. If a driver is used, then the status can also be read in the print monitor. If paper jam sensor is activated printing will stop until paper jam sensor is deactivated. The LED will show these conditions.

The LED will show these conditions

LED	Error
Off	No Error
Flash 1Hz	Paper near end
Flash 2Hz	Paper jam
On	Both paper jam and near end

6.1.6 Power connector

Power connector CN7: 43045-0400 Mating connector TBA

Pin	Function	Pin	Function
1	GND	3	GND
2	+8.5V	4	+8.5V

6.1.7 USB connector

USB connector CN5: UBBR-04SW11 Mating connector:

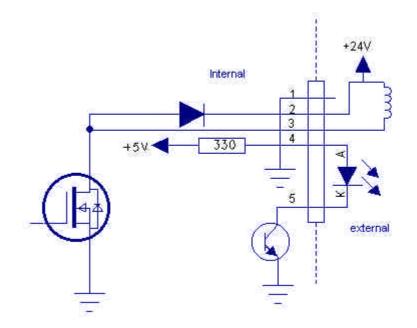

TBA

Pin	1	2	3	4
Function	N.C.	USB-	USB+	GND

6.1.8 AUX connector

Connector type CN11: 53324-0510 Mating connector TBA

Pin	1	2	3	4	5
Function	GND	Vcoil, Max 24V	Coil, max 1A	Anode	Cathode

Using output as cash drawer solenoid time must be set. By default solenoid time is 0,5 sec.

Using output for winding motor, connector must be applied. Upon feeding with motor the winding motor also turns. Please see manual for winding motor for more information

6.1.9 Serial connector

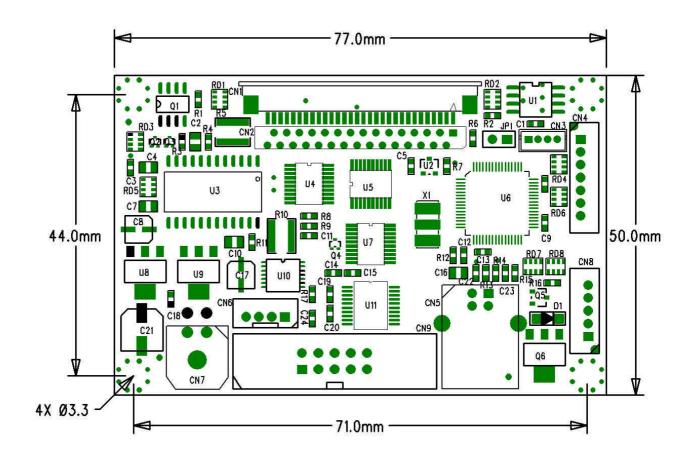

Connector type CN9: IDH10S1GN

Pin	Function	Pin	Function
1	NC	2	DSR
3	TX	4	CTS
5	RX	6	RTS
7	DTR	8	NC
9	GND	10	NC

Mating connector part number: FC10AGN (Taitek)

6.2 Mechanical Drawings

Decimal10[Description]When the printer controller receives this byte the text
data in the buffer will be printed

7.3 APS compatible command set (optional)

7.3.1 Escape sequences, overview.

GS / n	Set printing speed / Maximum peak current
GSDn	Set print Intensity
ESC v	Send printer status
ESCI	Send printer identity
ESC @	Resets printer
ESC S	Puts the printer in sleep mode
GSBn	Serial Communication setting
GSbn	Set parallel port Busy line hold time
ESC % n	Select internal Character Set
ESC R n	Select international character Set
ESC 3 n	Set line spacing
ESC SP n	Set character spacing
ESC ! n	Set print mode
ESC { n	Set/reset Rotated character
LF	Line feed
CR	Carriage return
ESC J n	Feed paper (n dot lines) forward
ESC j n	Feed paper (n dot lines) backward
CAN	Cancel print data buffer (text mode)
ESC * n1 n2 n3 n4 n5 n6, data	Print graphics
ESC \$ n1,n2	Horizontal dot positioning
ESC V n1,n2,n3 data	Horizontal bit image
ESC m	Partial cut
ESC i	Full cut
GS k n [Start] <data> NUL</data>	Print bar code
GShn	Barcode Height
GS w n	Barcode magnification
GS H n	Text position in Barcode
GSLn	Set Mark length
GS T n Se	Set TOF position
GS E	TOF feed paper
GS X n1 n2	Set Mark to Cut Position
GS x n1 n2	Set Cut Line to Head Dot line Length

GS / n Description:

Set printing speed / Maximum peak current/ Dynamic division

Format: Comments:	<1Dh> <2Fh> <n> n=1 to 32: (Default n=5) Software programmable consumption (Dynamic division). The maximum number of black dots which are simultaneously heated is (n+1) x 8. In Default Mode, n = 5.</n>	
Example:	n=5 Maximum black dots heated: (5+1)*8=48. Printer Peak consumption @5V: (0.3A (Stepper Motor) + 5*48/160) = 1.8A 160 Ohms is the dot resistance.	
GSDn		
Description:	Set print Intensity	
Format:	<1Dh> <44h> <n></n>	
Comments:	n=8Fh (127d) : (Default). Nominal print intensity n>8Fh (127d) : Printout becomes darker n<8Fh (127d) : Printout becomes lighter (n from 0 to 255 (FFh)).	
ESC v		
Description:	Send printer status	
Format:	<1Bh> <76h>	
Comments:	The printer returns a single byte that reflects the status of the printer in accordance with the following table:	
BIT FUNCTION BIT		
•	e OK Too high or too low	
1 Head-up No Yes		
2 Paper out No Yes 3 Power supply OK		
	ady Action in progress	
5 On/Off line Off Or		
6 Hole/Mark detecti	on Error No Too short, too long or not found	
7 Cutter failure Yes		
This command is ex case of a full buffer	ecuted immediately after being received, even in	
	Busy active). Host must disable the handshaking	
controls to send the		
command.		
. .	allel port, the software continuously updates PE	
signal. To read the status byte, use the Byte Mode (Parallel communication) as described		
in section 3.4.2, after having sent the ESC		
naving sent the ESC		

7.4 ESC/POS compatible command set (optional)

7.4.1 Escape sequences, overview.

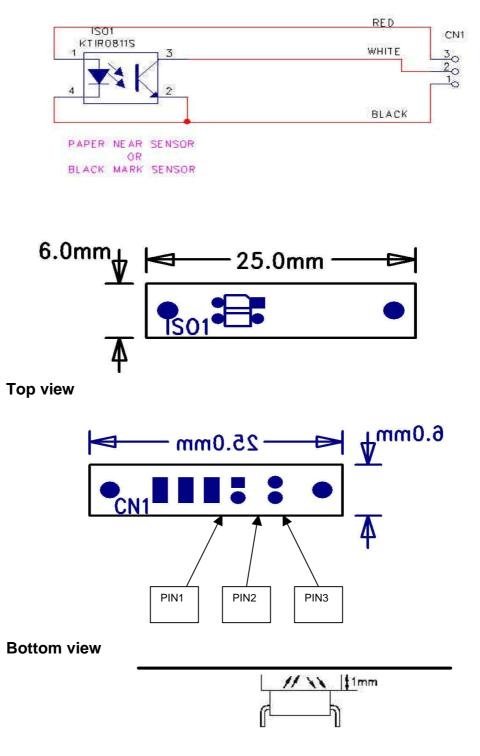

ESC c 4	Select Paper Near End Sensors to stop printing
НТ	Horizontal Tab
LF	Print and Line feed
FF	Print and return to standard Mode
CR	Print and carriage return
DLE EOT n	Real Time status transmission
DLE ENQ n	Real time request to printer
CAN	Cancel print data in page mode
ESC FF	Print data in page mode
ESC SP n	Set right side character spacing
ESC ! n	Select print mode(s)
ESC\$ nL nH	Set absolute print position
ESC * m nL n H	Select bit image mode
[d]k	
ESC - n	Turn underline mode on/off
ESC 2	Select 1/6-inch spacing
ESC 3 n	Set line spacing
ESC = n	Set peripheral device
ESC ? n	Cancel user defined characters
ESC @	Initialize printer
ESC [n] k NUL	Set horizontal tab position
ESC E n	Turn emphasized mode on/off
ESC G n	Turn on/off double strike mode
ESC J n	Print and feed paper
ESC L	Select page mode
ESC R n	Select an international character set
ESC S	Select standard mode
ESC T n	Select print direction in page mode
ESV V n	Turn 90°clockwise rotation mode on/off
ESC W xL xH yL	Set printing in page mode
yH dxH dyL dyH	
ESC c 5 n	Enable/Disable panel buttons
